1 INTRODUCTION

This document is a summary of what I've learned while being an intern at Juvo. The setup of the program was simplify the handling of resume of consultants. At first all text was recognized or converted as plain text. So everything was compacted into one long file. Recently we started converting this process, with google vision, it recognizes in what blocks text should belong together.

In this project my main focus was front-end. This is what interested me the most and where I wanted to improve the most in. This was of course not the only thing I did, the mentors always said it's important to learn full stack. So with this in mind I started in backend. While this was a bit more challenging, I still learned a lot.

2 PERSONAL REFLECTION

it was challenging but also fun in a way that I didn't expect. The reason for this was that the coherence between the team was great and together with the mentors we could have some fun. Being this great community you had always a place to go for help. So I've learned to ask a lot of questions. Mostly to my team, but if couldn't be solved the mentors where always there.

The field where I learned the most in was front-end. Writing in Angular was something I already enjoyed, and now with the extra tips and tricks, I am comfortable to write programs in this framework. Most importantly our mentors had an eye for detail, so we always had to write the most efficient code. At first it was a bit hard, because I was still learning. But even now, if I look back at my code I am glad they asked to refactored it.

In back-end I also started to find my way. Here the most important thing I learned was to use streams in Java. I've never done it before so it was a huge learning process. Now it is decent, but I can always improve on this subject more. Even if back-end was my least favourite/developed side, I again learned a lot and even used things I leaned in my own projects.

Even my soft-skills have improved because of the bi-weekly demonstrations, and questions to business. With these questions we could plan our next sprint better because we know out priorities. Or even get feedback on what should be different.

2.1 Conclusion

Overall I really enjoyed this internship. We had some great times and some less great, but we always knew what to do, or I was helping others so we could move on as a team.

I am definitely sure I will be using feedback and things that I've learned later in my working life or other projects. So I am really grateful I could start my internship in an amazing and fun company.
